Lab 1: The AI Synthesizer Me@Work Associate App

Data: 30 reviews | **Avg rating:** 2.87/5| **Method:** theme clustering + frequency; prioritize blockers + impact

Prompts used to query the data

- "Group the 30 reviews into themes; output top pain points with frequency and representative examples."
- "Extract feature requests, de-duplicate, and rank by frequency and business impact."
- "Recommend Top 3 must-have features for next releases and actionable P0/P1/P2 next steps."

AI-synthesized output

What users like: all-in-one schedule + paystub, schedule-change notifications, improved schedule view/helpful for new hires.

Top 3 user pain points

- Reliability in critical flows (Schedule/Pay): crashes/white screen/schedule stuck loading (5 mentions) undermines trust and forces calls/reinstalls.
- Schedule freshness & accuracy: slow loads, outdated schedules, delayed updates (3 mentions) risk missed shifts and manager/associate mismatches.
- Access & usability friction: lockouts/reset-password loop + repeated 2FA, plus clunky navigation (3 mentions) blocks adoption even when data exists.

Top 3 feature requests

- In-app shift actions (swap/post shifts) + request time off (3 mentions) so associates can self-serve without calling managers.
- Upgrade "Ask Sam" for real in-store help (accurate answers + item location + barcode scan) (2 mentions).
- Store/team coordination layer (4 mentions): team schedule visibility, in-app associate messaging, store-specific news/alerts, and daily task visibility.

Top 3 must-have features (recommended priorities)

1. Crash-free, fast, real-time Schedule + Pay (including stable paystub/PDF viewing).
2. Self-serve schedule management: swap/post shifts + request time off with an approval workflow.
3. In-store productivity mode: improved Ask Sam (barcode scan + item location) plus store alerts/tasks.

Actionable insights / next steps

- P0: Fix crashers/compatibility (latest Android), stabilize PDF viewer, and add monitoring (crash rate, schedule load time, paystub open success).
- P1: Improve schedule sync (pull-to-refresh + last-updated timestamp + real-time updates) and reduce login friction (biometrics/trusted device; fix reset loop).
- P2: Personalization quick wins: notification preferences, dark mode, pay filters (OT/bonus) and pilot store-specific news/alerts + task integration.

Lab 2: The Metrics & OKRs Draft

1) Prompts Used

- **Prompt 1:** "Using the Associate Shift Swap (v1) brief, draft Q1 OKRs (1 Objective + 3-4 measurable Key Results). KRs must be outcome-based (not tasks), include targets by end of Q1, and align to v1 scope: post shift, browse/claim, manager approval, notifications."
- **Prompt 2:** "Refine the OKRs: add clear metric definitions/baselines where needed, include at least one quality guardrail, and replace any task-like KR with a measurable result."

2) AI-Generated OKRs (Draft)

Objective: Enable associates to swap shifts self-service while maintaining store coverage and reducing manager overhead.

Key Results:

- **KR1 (Adoption):** Pilot Shift Swap v1 with >=5,000 associates; >=25% of eligible associates complete at least one approved swap by end of Q1.
- **KR2 (Manager efficiency):** Reduce manager time spent coordinating shift coverage by 40% vs. baseline in pilot stores by end of Q1.
- **KR3 (Time-to-decision):** 90% of posted shifts reach a final status (approved/declined/expired) within 24 hours by end **of Q1.**
- **KR4 (Quality):** <1% of completed swaps require manual schedule correction; 95% of swap-status notifications delivered within 1 minute by end of Q1.

3) PM Critique

This is a solid first draft: the Objective links customer value (flexibility) to business value (reduced manager overhead and protected coverage), and the KRs focus on measurable outcomes (adoption, time saved, speed, and quality guardrails). The main refinement I would make is to tighten measurement definitions, so results are unambiguous. For KR2, we need a clear baseline (e.g., minutes/week per manager spent on coverage coordination) and a consistent measurement method (workflow telemetry and/or time study). For KR3, I would split "final status within 24 hours" from the "swap success rate" to avoid accidentally optimizing fast expirations; e.g., add a separate target for % of posted shifts that are claimed and approved. Finally, I would segment adoption/quality by role or department to confirm the v1 eligibility rules work broadly within the pilot.
